MOBILE-ASSISTED LANGUAGE LEARNING (MALL)

Assoc.Prof.Dr. İsmail ÇAKIR, Erciyes University, Faculty of Education, English Language Teaching
Department ismailcakir@erciyes.edu.tr

Prompt Questions:

1. What instructional materials did ELT teachers mostly use ten years ago?
2. Do you believe that students should be allowed to use mobile phones in the class?
3. What benefits do foreign language learners get from mobile devices?
4. How do you define yourself as a language teacher: digital native or digital immigrant?
5. What are the impacts of new innovations in technology on foreign language learning and teaching?

INTRODUCTION

Any tool that can increase students' access to the language will contribute greatly to their progress (Reinders & Cho, 2010).

Teachers in EFL classrooms used to be mostly dependent on coursebooks, chalkboards (Klopfer, 2008), and then audio and audio-visual materials. Yaman, Şenel and Yeşilel (2015) also believe that the foremost sources of information in the past have been printed reference books and encyclopedias, but today, all manner of information can be sourced from a single medium, namely the Internet (p.1). That is to say, with the rapid advance of technology new materials that derived from computer and Internet started to be implemented in teaching and learning English. Traditional materials such as chalkboards and coursebooks couldn't resist this transformation any more. Students are now able to use new technology-based materials not only in the classroom but also out of the walls of it. The abundant use of technological materials, especially personal devices such as tablet PCs personal digital assistances (PDA), mobile phones, digital audio and video players, offered students a wide variety of sources that can easily be utilized for educational purposes. In this context, the use of technology, Information Communication Technologies (ICT) in particular, for an enormous range of purposes by students has made it an unavoidable part of language learning.

Needless to say, technology, which is defined as anything that makes our life easier (Oelofse, 2008), has unquestionably a great impact on people's daily life. Being an indispensable part of daily life makes it exciting and challenging for those who want to exploit this affordance for multiple purposes including language learning. It is apparent that today those who have mobile devices are increasing so rapidly that it is possible to confront the students owing at least a mobile device, mostly mobile phone. In other words, almost every student owns at least a mobile phone or other mobile devices such as, a game station, a laptop or an MP3 player (Ally, 2009). Thus, it is widely admitted that the new generation spends a great amount of the time on mobile technology. Unlike the generation of two decades ago, today's generation has much more digital fluency and familiarity with new technologies. For that reason, Prensky (2007) calls this generation as 'digital natives' or 'net generation' (Oblinger, 2003) who are advanced technology users (Dickerson, Williams, & Browning 2009).

Considering all the facts specified above, it is safe to claim that the technological devices deserve to be exploited for instructional purposes in order to accelerate their learning process. To support this view, Reinders (2010) believes that any tool that will promote students' access to learn will contribute greatly to their progress. So, it is an undeniable fact that needs to be elaborated by language teachers so as to bring the new innovative technology into the classroom.

TECHNOLOGY AND EDUCATION

As mentioned above, students use technology abundantly in their everyday life, and they find it quite valuable and motivating in learning a foreign language. The positive effects that ICT provide on students' motivation, engagement and attitudes towards the subject matters to be learnt make technology a tempting component of education. Furthermore, it can be asserted that the use of the technological tools in education such as computers, Internet, social networks, mobile technologies improve teachers' instructional process and facilitates students' learning process (Yunus et al., 2013). Pim (2013) claims that learners in this era are quite skillful in creating content and use it effectively with their friends for various purposes. They generally exploit Web 2.0 tools

to communicate and socialize along with improving their speaking, listening and writing skills. One of the important sources that technology provides is, of course, the Internet which offers a great amount of information from audio and video recorded materials. Thus, it becomes fast and easy for learners to obtain the related sources and create their own materials. Talking

electronic books, podcasts, videos, songs are a few to list that assist learners to learn the target language.

From the perspectives of teachers, technology gives the teacher autonomy to develop their own curriculum and “tailor instructions to sustain a positive interaction to increase learners’ interest and motivation” (Yunus et al., 2013). According to Pavlik (2015), innovation technologies have inevitably led to an unavoidable transformation in education in four areas: (a) transformation of the methods of teaching and learning; (2) reshaping of the content of what is taught and learned; (3) transformation of educational institutions, structures and costs; (4) redefining of the relationships between and among students, teachers and educational institutions.

Implementing Mobile Technology into Language Learning

The use of mobile technology at anytime and anywhere by learners makes it a crucial component of education, particularly language learning. The rapid transformation of Computer Assisted Language Learning (CALL) into Mobile Assisted Language Learning (MALL) has also brought huge transformation in foreign language learners’ attitudes towards language learning (Kukulska-Hulme, 2009). As Kukulska-Hulme and Shield (2008) emphasize MALL differs from CALL in its use of personal, portable devices. Mobile technology can help extend learner opportunities in meaningful ways (Thornton & Houser 2005). It is worth mentioning that mobile technology has had a great influence on the implementation of some techniques and methods of foreign language teaching. In this regard, several studies have been conducted and they have all proved the positive impacts of mobile technology on learners’ progress. To make the point valid, through MALL foreign language teaching has had various contributions to teach and practice vocabulary (Lu, 2008), to practice idioms (Thornton&Houser, 2005), to develop writing proficiency, to practice listening skill (Edirisingha et al., 2007), and to practice the target language pronunciation (Ducate & Lomicka, 2009). As can be noticed above, mobile technology needs to be implemented appropriately considering the fact that if a mobile technology or device becomes popular, it is worth exploring for possible application to language learning (Tai & Ting, 2011). While implementing these technological devices and tools, teachers and learners need to be knowledgeable enough. Technology, of course, is a phenomenon that cannot and shouldn’t be neglected as long as it is used effectively at the right time in the right proportion. The content and type of activities need to be chosen meticulously in order to save time and enhance learning. In this vein, Hockly (2013) argues that it is not the technology itself that enhances teaching or learning, but rather the use to which it is put. That is to say, it is useful to distinguish between mobile learning activities that focus on consumption of content, and activities that encourage the production of language. She agrees that Puente’s (2010) SAMR model would help teachers and learners as it can usefully be applied to the design of mobile learning activities for ELT. The SAMR model suggests that technology can be used in learning activities in the following ways:

- Substitution* : technology acts as a tool substitute, with no functional change
- Augmentation* : technology acts as a direct tool substitute, with functional improvement
- Modifications* : technology allows for significant task redesign
- Redefinition* : technology allows for the creation of new tasks previously inconceivable. (Cited as in Hockly, 2013, p.82)

As is clearly seen above mobile technology has an irresistible role in foreign language teaching and attitudes and beliefs towards teaching and learning need to be strictly revised in order to be able to keep up with the technology friendly learners. To do this, the SAMR model suggested by Puentedura (2010) would be a great help of teachers and course designers.

Mobile Learning

Mobile learning, or m-learning, has recently emerged as a new type of learning model which allows learners to obtain learning materials anywhere and anytime, which can be defined as the use of mobile or wireless devices for educational purpose while on the move (Kukulska-Hulme & Traxler, 2005). Using mobile technologies and the Internet (Lan & Sie, 2010) learners become more involved in learning process. Given that mobile learning refers to a set of technological devices, including smartphones, MP3 players and hand-held computers, learners get a huge benefit from these devices in language learning (Dudeney & Hockly 2007). Moreover, for some, such learning can be regarded as the facilitator of learning, and easily access to educational materials for students using mobile devices via a wireless medium (Litchfield, et al., 2007). That is, it is an education model that emerged with the development of mobile technologies (Odabaşı, 2009). It is admitted that face-to-face teaching in some certain situations is quite limited for many learners and they need more time and opportunities to interact and be exposed to the target language (Soliman, 2014). In order to compensate this gap and supplement the EFL face-to-face class, mobile learning or e-learning might be used (Soleiman, İsmail & Mustaffa, 2014). Besides, using real world resources for teaching and learning in the classroom can make education more meaningful and relevant to our students (Mcneal & Hooft, 2006). Some researchers also believe that learners become more successful in learning the target language when it is exploited appropriately.

What makes MALL attractive for language learners?

Learners find learning languages with MALL devices quite motivating due to their portability and ubiquity (Kukulska-Hulme, 2009). They promote interactivity, collaboration and engagement in various learning activities, and personalize learning by giving learners control over what, where, when and how they will learn, and create a sense of community (Kukulska-Hulme, 2009; Naismith & Corlett, 2006). It can provide a *blended learning* atmosphere which includes both face-to-face and online and offline learning experiences. Furthermore, easily access to resources that learners need at anytime and anywhere makes language learning more motivating. The activities that mobile devices offer, particularly mobile phones, are quite rich. Some of the common activities that learners frequently use can be listed as follows: to read e-books, to listen to audio and audio-visual materials such as podcasts, to share visual materials (video, photos etc.), to make social contact, to play games, to record audio and video documents, to make social contacts, etc. Having a wide range of features makes mobile devices more favorite instructional materials in learning. In a study conducted by Pearson (2013), 92% of the participants believe that these devices have a great impact on their learning.

Research also proves that mobile devices and activities used for educational purposes can promote *self-directed* forms of language learning and greater *learner autonomy* (Kukulska-Hulma, 2013). Therefore, learners' control over practice and flow of learning fosters independence. The other benefit of mobile learning is that learners' struggle to discover how language is used around the real world, which can be defined as '*noticing hypothesis*' (Schmidt, 1990).

Mobile Devices

The twenty-first century learner will benefit from well-designed learning materials so that they can learn from anywhere and at any time using mobile technology (Ally, 2009, p.1).

Mobile devices are revolutionary because they transcend the boundaries of the structural status of classrooms and lecture halls and enable formal and informal learning (Hussein & Cronje, 2010; Peters, 2007). These devices do not have to be utilized in a particular place to be effective with their small size and portability and opportunity, as their most important feature, provide the users with the opportunity for users to continue their education everywhere (Kukulska-Hulme & Traxler, 2007; Uzunboylu, Cavus & Ercag, 2009). These devices, such as laptop computers, smartphones, Personal Digital Assistants (PDAs), MP4 players, and tablet PCs with their accessibility and practicability, are acknowledged as a delivery channel with great potential for sustainable learning (Khanna & Singh, 2011). Some studies (Lu, 2008; Thornton & Houser, 2005) have indicated that learners generally have positive attitudes towards using mobile devices. Furthermore, Pachler (2009) claims that student-student **synchronous** and **asynchronous** communication can be held via mobile devices to portray social interaction that is mediated by cultural tools.

As set before, there are several mobile devices that can be listed to assist language learning, but two of these devices will be elaborated here because they are the most commonly used ones that learners have and exploit for multiple purposes, including language learning.

a. Mobile Phones

Among all technological devices available in our era, mobile phones are the most popular ones, and outnumber personal computers, and they have an important place particularly in young people's lives (Saran, Çağıltay & Seferoğlu, 2008;

Prensky, 2005). Although they were produced just to communicate at the beginning, according to Kelly and Minges, ‘they have evolved from a simple voice device to a multimedia communications tool capable of downloading and uploading text, data, audio, and video – from text messages to social network updates to breaking news, the latest hit song, or the latest viral video’ and they can also ‘be used as a wallet, a compass, or a television, as well as an alarm clock, calculator, address book, newspaper, and camera’ (2012, p.11). These functionalities are usually exploited both in and out of the classroom given that they promote interactive learning, high motivation, and immediate feedback for learners. Chinnery (2006) puts forth that mobile learning would become a fashionable channel for language study. As mobile phones are used by learners in their life for many purposes, they need to be utilized for educational purposes, too. Thus, learners can reach the authentic content and complete the required tasks. This fact is supported by Thornton and Houser (2005) in that students using mobile phones in learning became more successful than those using paper or web materials.

b. Tablet PCs

As a component of mobile learning, Tablet PCs also have benefits in education due to their mobile nature (Savaş, 2014). Since the birth of the Internet, computers and tablet computers in particular have become more common not only in regular classrooms, but also in EFL classrooms, where a global network allows a wealth of knowledge to be brought to students almost immediately at the touch of a button (Leis, 2014). Particularly in Turkey, as Çuhadar (2014) asserts, with the implementation of the FATİH Project (Movement of Enhancing Opportunities and Improving Technology, abbreviated as FATİH) in elementary and high schools, which aimed towards generalizing the use of instructional technologies, tablet PCs gained a great attention along with the Interactive White Boards. In general, Tablet PCs support teaching-learning processes and provide a collaborative interaction between students and teachers.

In order to use tablet PCs appropriately, the classrooms are equipped with Interactive Whiteboards (IWB). Although cannot be regarded as a mobile device, it has usually been used by teachers in the EFL classes to support and mostly to facilitate teaching and learning. A lot of web tools designed to teach and practice English can be used in the class using IWB. It is, undoubtedly, one of the most commonly used technological devices as it operates like a computer with a lot of functionalities. Dudeney (2006) agrees that IWBs make the computer invisible, as all interaction with both the hardware and the software takes place within the familiar confines of the board itself. It also enables learners and teachers to practice a lot of activities that require a lot of time to prepare. Some of the typical functionalities can be listed as follows: write or draw, save, change or erase, show view, revisit saved digital boards, video player, access the Internet etc. When considered as a supplement to mobile phones and tablet PCs, IWBs would be a great help of language learners and teachers in the class.

TEACHING FOREIGN LANGUAGES THROUGH MALL

Research proves that MALL has drawn the attentions of many researchers to find out its effect on language learning. Speaking, listening, vocabulary, reading and grammar aspects of language learning have been explored by several researchers such as Hung, Hwang, Su, and Lin, (2012); Kukulska-Hulme (2005); and Liu and Chu, (2010). The results generally proved that MALL consistently benefits young EFL learners' reading development, improves EFL learning attitude, and enhances students' cooperative learning skills (Lan, Sung & Chang, 2013). As instructional activities are not limited to a set place, learners are able to engage with teachers learning resources and other learners asynchronously (Bornman, 2012).

Mobile Assisted Language Learning (MALL) is one of the most interesting emerging types of technology enhanced learning (Kelly & Minges, 2012, p.11). It is the intersection of CALL and m-learning with its specific characteristics (Stockwell & Hubbard, 2013). As interaction and autonomy are two key concepts in MALL, mobile

devices have gained much more importance. Ubiquitous access to mobile phones and other portable devices means that language learning increasingly straddles classroom-based learning and learning outside the classroom, in virtual spaces and out in the world (Kukulska-Hulme, 2013, p.2).

Suffice it to say that language learning heavily depends on the availability of the related input which is not always possible in the classroom only. In this respect, mobile device use to get appropriate input would have an important impact. It is observed that today's generation's mobile device preferences are mobile phones, tablet PCs, iPods, and MP3 players respectively (Soleimani, Ismail & Mustafa, 2014).

It is also worth highlighting that, when used properly, it is possible to see that MALL based activities have a great impact on promoting learners' language development, reducing anxiety, increasing motivation and positive attitudes towards learning (Yanguas & Flores, 2014).

MALL in Developing Language Skills

Vocabulary: Learners' preferences in using MALL to practice and learn the target vocabulary is one of the most frequently utilized activities. In order to gain appropriate language input, learners utilize SMS and e-mail messages (Thornton & Houser, 2005), nowadays whatsapp messages, audio and video functionalities of the mobile devices (Başal, et al, 2016). Learners and teachers can utilize such devices for multiple purposes to teach and practice pronunciation (Ducate & Lomicka, 2009; Godwin-Jones, 2008) to support vocabulary learning (Lu, 2008) and to administer quizzes (Saran & Seferoglu, 2010).

Reading: Reading skills of the learners can be improved through MALL based activities (Chen & Hsu, 2008). Especially mobile assisted extensive reading programs (Lin, 2014) and e-books (Chang, Liang, Yan, & Tseng, 2013) include a wide variety of reading activities that can be conducted either individually or collaboratively. It is likely that the rising popularity of e-books will gradually encourage more reading in a foreign language, particularly in English where there is a bountiful supply of popular texts available, many of them for free (Kukulska-Hulme, 2013, p.6.). That is, the use of mobile devices has become more common in many areas in daily life than previous years and the technologies like e-book have begun to replace printed materials (Acartürk, 2012).

Listening: One of the significant contributions of MALL to foreign language learning is that it fosters learners' listening comprehension when it is applied appropriately, particularly in extensive listening process. It is easy, comprehensible, and enjoyable for language learners and teachers to use listening peculiarity of mobile devices such as listening to audio books or radio programmes (Chang & Millet, 2014). When it is integrated into reading skill with the help of the audiobooks, mobile e-books with multimedia features of mobile devices, it is highly expected that learners greatly foster their listening and reading comprehension abilities along with the development of correct pronunciation (Çakır, 2012).

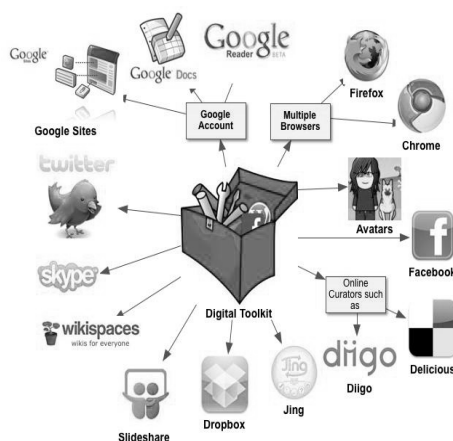

Speaking: Learners have a lot of opportunities to improve their speaking skills through the applications and MALL based activities. They can use voice and video recording function of mobile devices to practice speaking.

Writing: To develop writing skills mobile devices can be used by learner and teachers especially in self-editing, and keeping journals. Peer editing might also be beneficial for learners to analyze the written products. Commentary parts of some photo-sharing websites would develop learners reading and writing abilities as well (Barton & Lee, 2013).

Mall Tools

Language learners can use some tools available on the Internet to improve language accuracy, fluency and appropriacy. They might be exploited for different purposes.

- a. Blogging:** A blog is an electronic journal where readers post their thoughts and opinions on a regular basis (Lewis, 2009). To Holder (2006), online blogs allow students to get feedback from more than one person, and this type of peer feedback may be more effective than traditional self-

editing. Learners commonly share information and opinions in texts and pictures through mostly commercial applications of Facebook and Twitter nowadays. It can be used as a valuable tool for teaching writing in foreign language teaching. Online publishing enables learners to create e-portfolio, promote critical skills and responsibility, etc.

- b. Wiki:** It is an online platform where the users create and edit their own materials. Wiki allows students to work collaboratively on a common webpage. It can be a useful tool to support “process writing” as it allows learners to brainstorm, draft, revise, edit, and publish their written documents (Lewis, 2013). Wiki can also be used as a site for a class to share information among the class members or a place to collect information on a particular topic.
- c. Podcast:** Podcast can be defined as the combination of two words *iPod* and *broadcast*, which includes audio or video files that are broadcast via the Internet. They can be either downloaded or listened to on a computer or mobile device as a personalized tool. Target language audio recordings in learning and teaching activities have a lot of benefits that podcasting provides as an authentic and mostly free teaching and learning tool (Chinnery, 2006; Gromik, 2008; Kukulska-Hulme, 2009; Rosell-Aguilar, 2013). Rosell-Aguilar (2007) believes that podcasts offer two main contributions to foreign language learners. Firstly, they have authentic content which is provided by native speakers or advanced learners, not intended to teach language and referring to subjects such as news, football, or radio programming. Secondly, they may include language courses or teaching content specifically designed for language learning (audio recordings of texts, oral quizzes, oral feedback, and vocabulary items).
- d. Digital Portfolios:** As an alternative assessment technique portfolios are commonly used in EFL classes. Due to physical size of portfolios many teachers tend to use digital portfolios where they can assess and store the portfolios using the electronic facilities. Furthermore, teachers also can create their own portfolios to assist their teaching (Lewis, 2013).
- e. Games:** Recently, online games have become more popular among a great amount of foreign language learners and teachers, which naturally deserves to be exploited in ELT settings (Godwin-Jones, 2014, Thorne, 2008). Digital gaming offers a rich opportunity to many young learners who are not so much interested in formal education, but playing digital games. Godwin-Jones (2014) states that “If language learning can be tied to popular forms of gaming in a way that does not inhibit its enjoyment, that’s a winning situation both for students and educators” (p.9).
- f. Virtual Learning Environments (VLE):** A Virtual Learning Environment (VLE) is a website that brings together a number of resources for running a course (Scrivener, 2011). This includes software programmes designed to manage, track, and administer learning. The most popular programmes used commonly for educational purposes are Edmodo and Moodle.

What does Mobile Learning Offer?

Using mobile devices for educational purposes is becoming a common expectation of learners (Lan & Huang, 2012). As the devoted time to teach every single linguistic item in detail in class is quite limited, mobile learning needs to be one of the instructional components to compensate the gap. For that reason, mobile technologies need to be incorporated into school curriculum. Internet can help to design activities that fuel these perceptions and support intrinsic motivation (Davies, 2014). Through MALL learners can take more responsibility for their own learning, and thus they develop “learner autonomy” (Benson, 2007). Besides, learning activities carried out collaboratively or communicatively through mobile devices help learners develop cognitive and social abilities.

Characteristics of Mobile Learning

Related literature attributes some distinctive features to mobile learning and mobile technologies. Some of the significant ones are listed below:

- **Asynchronous:** It facilitates the co-creation of content where learners interact with peers by composing, editing and exchanging texts using the tools like email, blogging and the collaborative development of wikis (Terrell, 2011)
- **Bite-sized learning:** Short learning modules can be attached in the abstract through bite-sized approach which necessitates ‘bite-sized’ learning (Kukulska-Hulme, et al., 2005).
- **Blended Learning:** Mobile learning supports blended approaches in teaching and learning environment to present pictures, graphs, animations, simulations, and video clips to learners (Naismith, et al., 2004).
- **Collaborative Learning:** It is believed that learners enhance collaborative learning through MALL. The use of Internet and tools of websites, blogs, and social networking sites provides learners with opportunities to interact and work collaboratively in producing a work, which can finally be published or broadcast on the net or somewhere else. Thus, it supports communication among students through collaborative learning activities (Uzunboyulu, Çavuş, & Erçağ, 2009).
- **Connectivity:** This feature enables learners to connect and communicate with the related learning resources with the wireless network. They can also be connected to other devices to gather or share data.
- **Different Learning Strategies:** Through mobile learning, different learning strategies can be activated or developed.
- **Instant:** Using a mobile device provides quick answers to specific questions (Cohen, 2010).
- **Interactive:** The multimedia capabilities provide students interactive practice materials at the touch of a button (Liu et al, 2014).
- **Learner Autonomy:** Technology itself does not bring about autonomy but with the appropriate support, guidance, training, and scaffolding, it can help learners to gradually become autonomous (Arnó-Macià, 2012).
- **Motivating:** It boosts learners’ motivation as it collaboratively assists learners in both informal and formal environments in managing activities and to complete tasks (Laurillard, 2006).

- **Mediator:** For providing dynamics of communicative mediations, the mobile device is used as a mediator to facilitate output and promote interaction among students and teachers (Tai, 2012).
- **Personalized:** Usually, only one learner at a time has access to the mobile device depending on the preferences. The learner gains access to and downloads information independently from other learners (Zhang, 2003).
- **Portability:** Unlike CALL devices, MALL devices are small and easy to carry with their small sizes and weights.
- **Self-study:** Learners can use MALL for self-study purposes as they won't be in need of a teacher's assistance or guidance.
- **Spontaneous:** Mobile learning, unlike other types of learning, might occur spontaneously as it doesn't always require a systematic or planned learning.
- **Synchronous:** It provides video-conferencing and face-to-face interaction through online virtual worlds (Hew & Cheung, 2010).
- **Task Based:** It enhances the productivity, creativity, effectiveness, and efficiency of mobile subscribers (Gayeski, 2002).
- **Ubiquitous:** It can be used anywhere at any time. Being available makes mobile learning more distinguished than other technology assisted language learning situations.

MALL ACTIVITIES AND LEARNING THEORIES

According to Naismith et al., (2004, p. 5) MALL based activities can be categorized into the following theories:

- **Behaviorist:** The MALL based activities such as drills, drag-and-drop, repetition, and giving feedback promote learning as a change in learners' observable actions. Through these activities learners are required to achieve some developments in some certain fields.
- **Constructivist:** The MALL based activities allow learners to construct new ideas or concepts based on both their previous and current knowledge such as participatory simulations.
- **Situated Learning:** Activities promote learning within an authentic context and culture such as problem and case-based learning, context awareness (Lave & Wenger 1991).
- **Self-regulated learning:** Learners can control their own learning throughout the activities where mobile devices are used.
- **Authentic learning:** Learners can access to authentic resources to practice and learn the target language.

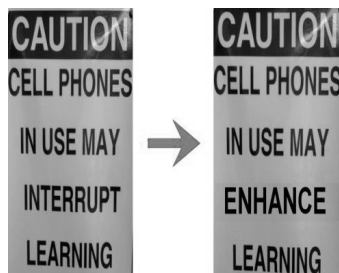

Basic Advantages of Mobile Technology

It is apparent that mobile technology includes a wealth of learning environments and activities for foreign language learners that they can utilize in and out of the classroom which is much more challenging and motivating than the traditional instructional materials such as books, audio and video technology. In general, some of the advantages of technology, in particular MALL (Ally, 2009; Butler, Pacoe, 2009; Chinney, 2006; Ushiada, 2013;), can be summarized as follows:

- It provides interaction and communicative activities.
- It fosters understanding of the socio-cultural aspects of the language.
- It provides comprehensible input and facilitates student production.
- It provides sheltering strategies for language development and content-specific understanding (modelling, bridging to students' background experiences, contextualizing, metacognitive activities, etc.).
- It uses task-based strategies.
- It offers authentic materials.
- It provides communicative language practice.
- It supports cognitive abilities and critical thinking skills.
- It uses collaborative learning.
- It facilitates focused practice for the development of reading, writing, listening, and speaking skills across the curriculum and disciplines.
- It is student-centered and, addresses specific needs of students.
- It uses multiple modalities to support different learning styles.
- It meets affective needs of students: motivation, self-esteem, and autonomy.
- It allows learners to access learning materials and information from anywhere and at anytime.
- It facilitates learning with various applications.
- It provides appropriate feedback and assessment of content knowledge and English skills.

Limitations of MALL

As it is widely accepted that mobile phones are not designed for educational purposes, it is not always possible to fulfill all the tasks due to some constraints they have such as small screen, reading difficulty on such a screen, data storage and multimedia limitations, virtual keyboarding, and the like (Kukulska-Hulme & Traxler, 2005). According to the study conducted by Kim and Kim (2012), small screen size was found to create cognitive disadvantages related to students' attention and visual perception. Similarly, Ushiada (2013) argues that it wouldn't always be possible to develop some language skills using mobile technologies because of their small sizes.

It can also be added that MALL includes limited nonverbal communications, limited cultural and social contexts. Colpaert (2004) also mentions that mobile technologies are advancing, and their output is quickly moving from verbal to visual, a clear disadvantage for language learning. Additionally, Kukulska-Hulme (2013) claims that some learner groups benefit from mobile learning to some extent, but they may face some challenges.

CONCLUSION AND SUGGESTIONS

As the world increasingly enters the classroom through ubiquitous connectivity, mobile devices become multiple small windows on the world, bringing in new perspectives and resources (Kukulska-Hulme, 2013, p.10). It is believed that the quality of the teaching-learning process highly depends on understanding the science concerning the relationship between knowledge, the teacher and the student (Mounier & Tangchuang, 2010). These three factors need to work collaboratively in teaching any topic, in particular a foreign language. Students, as digital natives or net generation, in our age have different expectations and opportunities than their counterparts one or two decades ago. To this end, MALL as an innovative approach possesses this potential that needs to be scrutinized in detail. Exploiting the MALL devices properly and introducing the new facilities seem to be something quite normal for the new foreign language learners.

As mobile learning is ubiquitous and relevant to interactive learning, the foreign language teaching classroom should be refined (Anohina, 2005). As repeatedly cited in this chapter, mobile devices have a lot of benefits for foreign language learners in developing correct pronunciation, promoting listening skills, improving reading skills, enhancing writing ability, getting feedback from teachers via SMS, delivering homework and tests via SMS and so forth (Çakır, 2015). Furthermore, MALL based activities enable learners to have positive attitudes (Markett, Sanchet, Weber & Tangney, 2006; Saran & Seferoğlu, 2010), promote active and collaborative learning environment and offer an authentic learning community.

The research accumulated so far displays that MALL offers a lot of things for the benefits of language learners. As Kukulska-Hulme (2013) suggests, language learners should be able to utilize available technological means and understand their impacts on language evolution (Kukulska-Hulme, 2013). Particularly, multimedia training materials such as visual and audio training documents, Internet, simulations, animations, e-libraries, e-books, projections, tablet, smart board etc. can help students to easily understand subjects and embody the information (Soykan, 2015). In using the related device for educational purposes in a relevant MALL environment the learner should be ahead of technology.

Apart from learners, language teachers must also be well-prepared, well equipped, ready to adapt and adopt the recent technological innovations so that they can integrate MALL technology into school curriculum and syllabus. As teachers, we need to develop pedagogies to harness the opportunities that such complex devices offer, and we need appropriate constructs to understand, describe, and investigate what this means for language education (Jarvis, 2015). The other important factor for teachers to keep in mind is that mobile learning devices are just instructional tools, rather than the instructors themselves, and their effectiveness depends on the existence of an effective instructor who is equipped with good pedagogical knowledge (Chinnery, 2006). They should support and supplement traditional classroom instruction rather than seek to replace it (Ala-Mutka, 2010).

To conclude, Stockwell and Hubbard (2013) believe that affordances and limitations of the mobile device need to be taken into consideration while using mobile activities

in a language learning class, and these activities and tasks need to be short and succinct when possible. They add that teachers should let the technology and environment fit the task, and guide and train learners effectively to use mobile devices for language learning. Simply put, in order to make MALL effective in learning a foreign language, the choice of device and content, learners' needs and learning environment should be well-planned. As Hockly (2013 a) suggests, no matter they are so technology friendly, some key skills such as the ability to evaluate online sources, to filter and manage information, or to synthesize information found online, need to be explicitly taught if educators are to prepare learners for the twenty-first century workplace.

TEN-ITEM SUMMARY

1. Students are now able to use new technology-based materials not only in the classroom but also out of the walls of it.
2. The use of the technological tools in education such as computers, Internet, social networks, mobile technologies improve teachers' instructional process and facilitates students' learning
3. Mobile technology has an irresistible role in foreign language teaching and attitudes and beliefs towards teaching and learning need to be strictly revised in order to be able to keep up with the technology friendly learners.
4. Face-to-face teaching in some certain situations is quite limited for many learners and they need more time and opportunities to interact and be exposed to the target language
5. MALL devices promote interactivity, collaboration and engagement in various learning activities, and personalize learning by giving learners control over what, where, when and how they will learn, and create a sense of community
6. Student-student synchronous and asynchronous communication can be held via mobile devices to portray social interaction that is mediated by cultural tools.
7. When used properly, it is possible to see that MALL based activities have a great impact on promoting learners' language development, reducing anxiety, increasing motivation and positive attitudes towards learning.
8. Through MALL, learners can take more responsibility for their own learning, and thus they develop "learner autonomy".
9. Apart from learners, language teachers must also be well-prepared, well equipped, ready to adapt and adopt the recent technological innovations so that they can integrate MALL technology into school curriculum and syllabus.
10. Affordances and limitations of the mobile device need to be taken into consideration while using mobile activities in a language learning class, and these activities and tasks need to be short and succinct when possible.

Biodata: İsmail ÇAKIR, PhD, works as an associate professor at Erciyes University, Faculty of Education, English Language Teaching Program in Turkey. His research interest is in teaching foreign language, teaching language skills, teaching culture, teaching methodology, materials development and teaching vocabulary. He has several national and international articles, book chapters and presentations on foreign language teaching.

APPENDIX 1. SUGGESTED MOBILE LANGUAGE LEARNING APPLICATIONS

- Grammar Up (to practice grammar)
- English LaunchPad (practice exercises, lesson plans, grammar structures, whiteboard, quiz generator, student tracking, student roster, translator and flash cards).
- Socrative (for creating instant formative and summative assessments)
- Learn English The Fun Way (grammar and matching activities)
- SpeakingPal (to record and compare the speech with a native English speaker)
- Grammaropolis (to make learning grammar more fun and exciting)
- iFPoems (collection of poems from famous poets around the world)
- Wordflex Touch Dictionary (to practice vocabulary)
- Dynamic English Lesson 3 – Idioms (it helps students learn and remember idioms using interactive games, fun graphics and practical examples.)
- iBooks (A complete book library for iPad users)
- Duolingo (<https://www.duolingo.com/>)
- Memrise (<https://www.memrise.com/>).
- Lingua.ly (<https://lingua.ly/>)
- LearnEnglish Grammar UK Edition | US Edition
- (<https://learnenglish.britishcouncil.org/en/apps/learnenglish-grammar-us-edition>)
- Johnny Grammar's word Challenge
- (<https://learnenglish.britishcouncil.org/en/apps/johnny-grammars-word-challenge>)
- SpeakingPal English Tutor (<http://www.speakingpal.com/hi>)
- MyWordBook 2 (<https://learnenglish.britishcouncil.org/en/apps/mywordbook-2>)
- Busuu (<https://www.busuu.com/enc/>)
- Fun Easy Learn English (<http://www.funeasylearn.com/app/learn-english/>)
- Phrasalstein (<http://www.cambridgemobileapps.com/vocabulary/phrasalstein.html>)
- Edmodo (www.edmodo.com)

NUANS, 1991 yılından beri yabancı dil eğitim/öğretim materyalleri alanında etkin olarak hizmet veren tecrübeli bir yabancı dil kitapçısı, yayınevi ve dağıtımıcısıdır. 2003 yılından itibaren Türk ve yabancı yazar, editör ve yayıncılarla işbirliği içinde, kaliteli, uluslararası standartlarda eğitim materyallerini Türkiye’de geliştirip, yayınlamak yayıncılık faaliyetine de başlamıştır. 2004 yılında Ankara merkezine ek olarak İstanbul ve İzmir şubeleri faaliyete geçmiştir.

NUANS, her yaş grubu için yayınladığı kaliteli dil öğrenim araç ve gereçleri ile dil eğitimini farklı ve eğlenceli şekilde ortaya koymayı amaçlar. Zengin **NUANS** kataloğunda hem dil öğrencileri hem de yabancı dil öğretmenleri için değişik eserler yer almaktadır.

NUANS, kendi yayınlarını üretmekle birlikte, Türkiye’de Ahead Books, Alma Edizioni, Anaya ELE, Build & Grow, Brookmead ELT, Collins ELT, Compass Publishing, e-Future, Egmont Easy Readers, Edizioni Edilingua, enClave-ELE, HarperCollins, Marshall Cavendish, Mundo Español, Russky Yazık Kursy, Sinolingua ve SM-ELE firmalarının da yetkili dağıtıcılığını yapmaktadır.

NUANS, yabancı dil eğitimi sektöründe dağıtımciğin yanı sıra yayımcı olarak da hizmet vermektedir.
